Consolidations Guide

How to run a consolidation event from the Oakridge Product Suite app, and how the Google Sheet behind it (ConsolMaster & ConsolLog) works.

Overview

Consolidations handles HQ-driven consolidation events — pulling specific product off the floor and packing it into boxes against a list HQ provides. The feature has two halves that work together:

The "O.P.S" website (this guide's Section 2)

What staff use in action: see what needs consolidating, count it as it's pulled, mark it 'Actioned', and log boxes as they're closed.

The Google Sheet (this guide's Section 3)

"ConsolMaster" is the HQ list, pasted in by hand. ConsolLog is a fully automatic history the app generates automatically as data is updated from the website.

1

HQ list pasted into
ConsolMaster sheet

2

Shows up in
Items to Consolidate on
website

3

Staff count with
'Actual Count' and mark
'Actioned'

4

Press 'Update' to send
progress from holding
section to the sheet

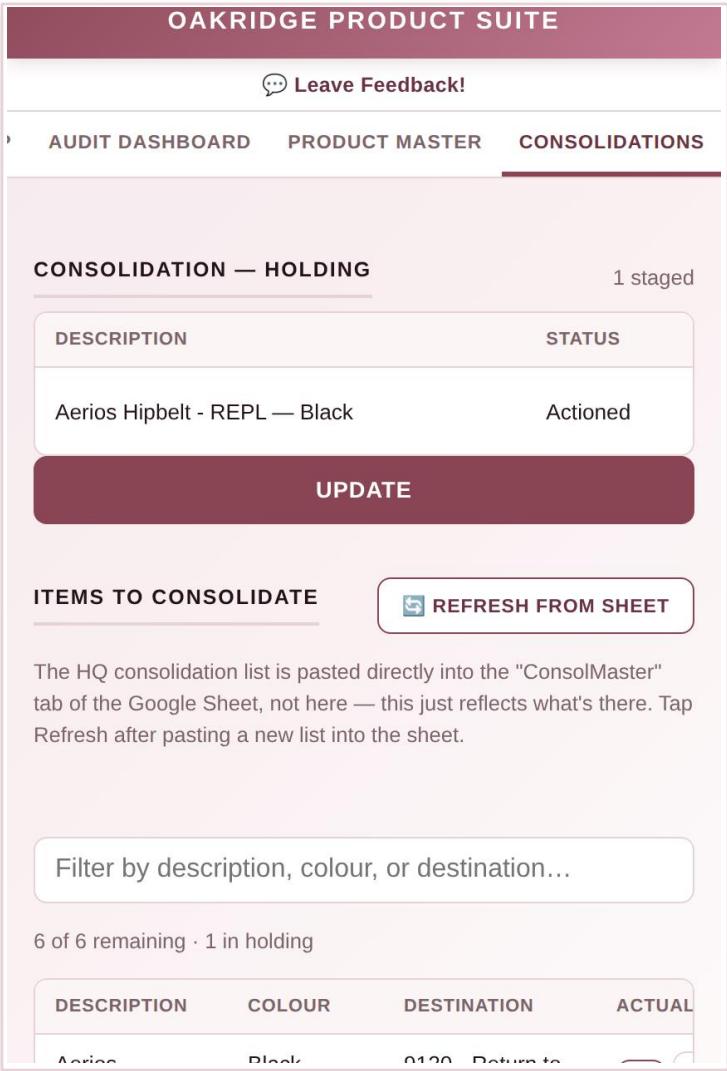

5

Each box scanned
& logged on its own

2.1 Consolidation — Holding

This sits at the very top because it's what you touch last in the cycle and most often need to see: everything you've marked Actioned but haven't pushed to the sheet yet.

- 1 To avoid miss-click mistakes the items are staged in a temporary holding section. Marking an item 'Actioned' (§2.3) stages it here, waiting for you to tap 'Update'.
- 2 Tap **Update** to push every staged item to ConsolLog and flag it 'Processed' on ConsolMaster, all in one request.
- 3 **Safe to leave staged.** If you get pulled away mid-event, anything sitting in Holding stays right here until you come back and tap Update.

Holding + the start of Items to Consolidate

2.2 Website Consolidation page – Product table

This is HQ's list, read straight from the ConsolMaster sheet — the app never writes to this list itself, it only displays it. See §3.1 for how the list gets there in the first place.

1 Refresh from Sheet pulls the latest ConsolMaster (and ConsolLog) — tap it right after pasting a new HQ list into the Sheet, or any time you want the newest state.

2 Filter box narrows the list by description, colour, or destination as you type.

3 A line disappears from this list the moment it's marked 'Processed' (see §2.3) — checked again on every refresh, and updated instantly the moment you push 'Update'.

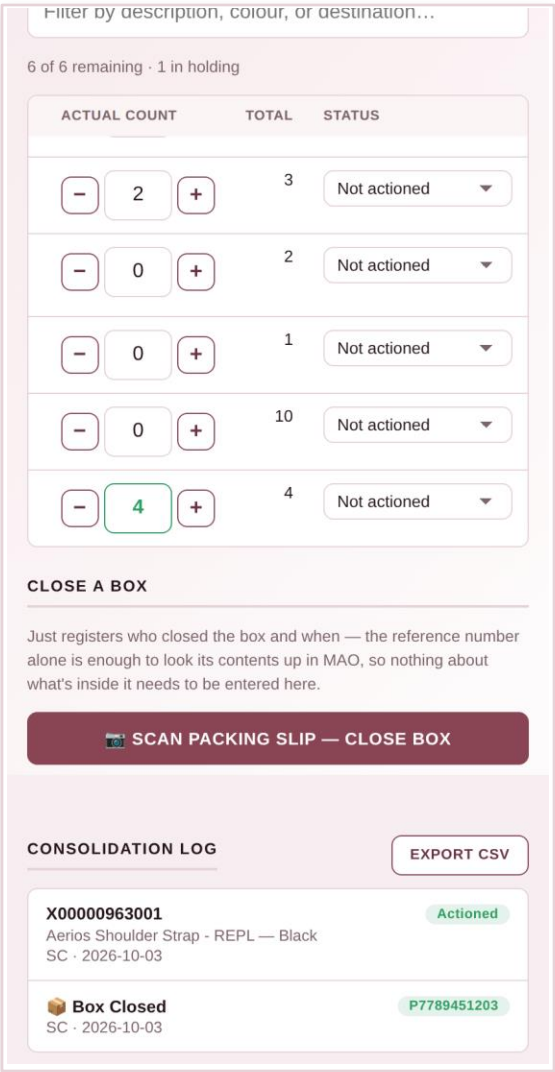

KEY POINT

The website never changes ConsolMaster as it acts as a reference only

2.3 Actual Count — counting as you pull

- 1 **Tap + or -** to walk the count up or down one at a time as you physically pull the product.
- 2 **Or tap the number itself** and type a value directly — faster than tapping repeatedly for a big count.
- 3 **It turns green** once Actual Count reaches that row's Total, so you can tell at a glance a line is fully pulled (according to the numbers from HQ*).
- 4 **Every tap saves immediately.** Unlike the rest of this page, Actual Count is not staged in Holding — each tap (or typed value) pushes straight to the Sheet on its own and overwrites the previous number in the cell whether + or - , so the count is live for anyone else looking at the same Sheet.

*These numbers from HQ are likely out of date since the time they generated the consolidations list, so use them only as a general indicator.

Actual Count, Total, Status, Close a Box, and the Log

2.4 Marking an Item 'Actioned'

- 1 Open the Status dropdown** on the item's row and choose 'Actioned' only once it's the items have been processed through MAO and are out of inventory
- 2 It moves to Holding** (§2.1) — nothing hits the Sheet yet.
- 3 Tap Update in Holding** when you're ready to commit — that's what actually writes to ConsolLog and flags the item Processed.

KEY POINT

Actioned stages the item in Holding. Update is what actually writes to the Sheet.

2.5 Close a Box

A separate action, independent of Holding/Update. It does not list the contents of the box, only records when and who closed it.

1 Tap 'Scan Packing Slip — Close Box' and scan the small barcode on the top right of the packing slip generated when you closed the consolidation in MAO.

2 That's it. The reference number, your initials, and the time are logged immediately. What was actually in the box is looked up in MAO by that reference number if needed, not here.

KEY POINT

Close a Box works any time — independent of everything else on this page.

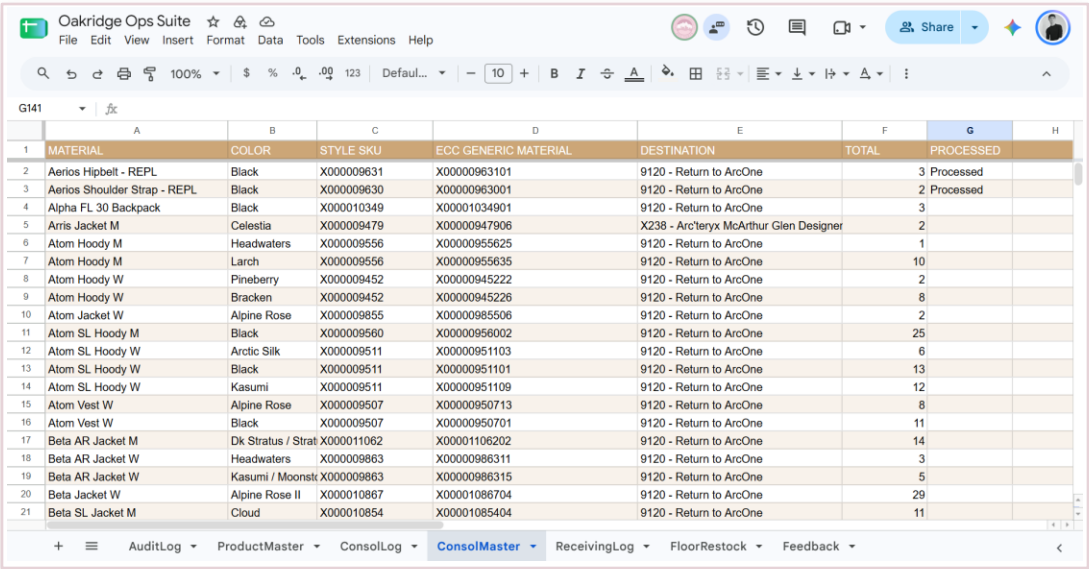

2.6 Consolidation Log

- 1 A running history** of every Actioned item and every box closed, newest first.
- 2 Export CSV** downloads the full log if you need it outside the app or open the sheets tab 'ConsolLog' to view history.
- 3 Actual Count doesn't appear on the websites log.** it's a live number the list above already shows, not a one-time event worth generating a new line for in this history.

KEY POINT

Actual Count is live, not historical — so it's shown above, not logged here.

3.1 ConsolMaster — the HQ List

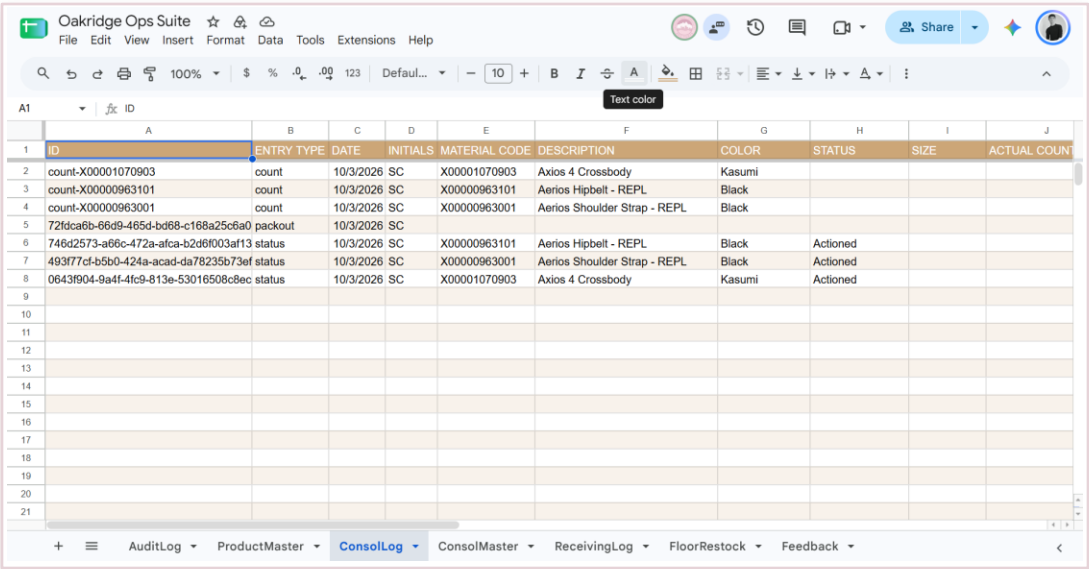

The ConsolMaster tab, pasted in directly from HQ's export

Column	What goes in it
MATERIAL	The product description, exactly as HQ sends it.
COLOR	Colour (or colour/pattern combo).
STYLE SKU	The style's SKU.
ECC GENERIC MATERIAL	The unique key for this line — the app matches every action on this row by this value. Must be unique per style/colour.
DESTINATION	Where the box is headed.
TOTAL	How many units this line expects — what Actual Count is compared against.
PROCESSED	Leave this blank. The app writes "Processed" here itself once an item is Actioned and Update is tapped.

How to load a new HQ list

- Copy column A – F (**Don't include headers**) and paste them unformatted (Ctrl+ Shift+V) into the ConsolMaster sheet.
- Go to the website and press the 'Refresh from Sheet' button to call the new information to the website.

3.2 ConsolLog — Automatic History

The ConsolLog tab, written entirely by the app

Don't hand-edit ConsolLog

Typing into this tab won't reflect on the website, and can confuse the "count" row-overwrite behavior. Fix it from the app, not the Sheet.

Every row here is created by the app, never typed in by a person. The ENTRY TYPE column says what kind of row it is, and which other columns are actually in use for it:

Entry type	Written when...	Columns that matter
status	An Actioned item is pushed via Update (§2.4).	MATERIAL CODE, DESCRIPTION, COLOR, STATUS
count	Every single Actual Count tap or typed value (§2.3). A repeat tap overwrites this same row rather than adding a new one.	MATERIAL CODE, DESCRIPTION, COLOR, ACTUAL COUNT
packout	A box is scanned closed (§2.5).	REFERENCE NUMBER only — nothing about contents.

4 Quick Reference

I want to...	Do this
Load a new HQ consolidation list	Paste it into ConsolMaster → tap Refresh from Sheet on the Consolidations page.
Record how many units I've pulled of a line	Tap +/- or type a number into Actual Count on that row.
Mark a line done	Status dropdown → Actioned → Update in Holding.
See what's still staged, not yet pushed	Check Consolidation — Holding, at the top of the page.
Log a box as closed	Tap Scan Packing Slip — Close Box and scan it — works any time, independent of Holding.
See the full history	Scroll to Consolidation Log, or tap Export CSV.
Pull in changes made on another device	Tap Refresh from Sheet — Actual Count and Resolve changes made elsewhere sync in too.
